In a single phase, two-stage photovoltaic (PV) grid-connected system, the transient power mismatch between the dc input and ac output generates second-order ripple power (SRP). To filter out SRP, bulky electrolytic capacitors are commonly employed. However, these capacitors diminish the power density and reliability of the system. To address this ...

This paper proposes a new voltage source inverter (VSI) referred to as a boost inverter or boost DC-AC converter. The main attribute of the new inverter topology is the fact that it generates an AC output voltage larger than the DC input one, depending on the instantaneous duty cycle. This property is not found in the classical VSI, which produces an AC output instantaneous voltage ...

DC-DC converters with voltage boost capability are widely used in a large number of power conversion applications, from fraction-of-volt to tens of thousands of volts at power levels from milliwatts to megawatts. The literature has reported on various voltage-boosting techniques, in which fundamental energy storing elements (inductors and capacitors) and/or transformers ...

The inverter power supply with a nominal power of 300W can be used for household electric fans, TVs, and daily lighting. The author has used a 300W inverter to power the above household appliances using a 12V/60AH battery. After a full charge, it can be used for nearly 5 hours. However, even if the battery voltage is sufficient, it still takes time to start a 180-liter refrigerator...

Output voltage, switching voltage, and inductor current for a buck-boost converter. When the switch closes, inductor current begins to increase, and the inductor stores energy in its magnetic field. When the switch opens, the inductor's current ramps down as its energy is transferred to the output section of the circuit.
