From the previous step, it is clear that our battery pack is made up of 4 parallel groups connected in series ($4 \times 3.2V = 12.8V$), and each parallel group has 7 cells ($6000 \text{ mAh} \times 7 = 42000 \text{ mAh}$). Now we have to arrange the 28 cells properly in the battery holder for making the electrical connection among them.

battery pack is removed from the system while under load, there is an opportunity for a damaging transient to occur. The battery pack should have sufficient capacitance to reduce transients or have something to clamp them. An even greater danger exists if there is a momentary short across the battery pack.
