How to calculate energy storage in passive components for MMC topology?

The energy storage in the passive components for the MMC topology can be obtained from equations below: where I_n , N , and V_{dc} designate the nominal arm current, number of cells per arm, and average operating voltage of the capacitor, respectively. The stored energy requirements for the MMC topologies is 40 J/kVA, according to .

What is the energy storage requirement for 2 L & 3 L converters?

According to ,2 L and 3 L converters have an energy storage requirement in the dc-link between 2 and 4 J/kVA. Therefore,both 2 L and 3 L presented equal stored energy requirements in the dc-link capacitor around 4000 J. For the inductor,the stored energy is 360 J and 1050 J for 2 L and 3 L,respectively.

What is energy storage in a DC-link capacitor?

Energy storage is an indirect measurement of the volume of the components. According to ,2 L and 3 L converters have an energy storage requirement in the dc-link between 2 and 4 J/kVA. Therefore,both 2 L and 3 L presented equal stored energy requirements in the dc-link capacitor around 4000 J.

What is a power reserve in a synchronous generator?

In this scenario,the power reserve is used to increase the torque and recover the nominal rotationof traditional synchronous generators. Studies indicate that BESS can be used to supply this additional power and support the grid during an overload [5,67].

Which inverter has the lowest harmonic distortion?

In relation to the total harmonic distortion (THD) of the injected current by the BESS into the grid,the MMC inverterpresented the lowest value among the other topologies,with a distortion of less than 1%,mainly due to its ability to synthesize a voltage with a higher number of output levels.
