There is great interest in exploring advanced rechargeable lithium-ion batteries with desirable energy and power capabilities for various applications. In practice, high-capacity and low-cost electrode materials play an important role in sustaining the progresses in this technology.

Self-discharge (SD) is a spontaneous loss of energy from a charged storage device without connecting to the external circuit. This inbuilt energy loss, due to the flow of charge driven by the pseudo force, is on account of various self-discharging mechanisms that shift the storage system from a higher-charged free energy state to a lower free state (Fig. 1 a) [32], [33], [34].

A good understanding to manufacturers and consumers of battery cells and systems about the dynamic behavior of their energy storage systems especially of the peak discharge power capability of lithium-ion-batteries is crucial for safe and reliable operation of hybrid and electric vehicles.
