An RV primarily draws its power from AC sources at "120 Volts." In reality, the 120 Volts is more of a rounded estimate, so you might see a bit of variation in the stated voltages of shoreline power pedestals. In the past, power companies sent 100 volts through the lines, but the amount has changed a couple of times over the last century.

The generator may be a modest size, maybe just large enough to charge batteries and run a few outlets. Or, it might be big enough (have enough watts) to power the whole RV just like normal. Of course, a big generator is heavy and large, requires fuel, and makes quite a bit of noise. An inverter is silent.
