Total Harmonic Distortion (THD), and dynamic range requirements of the Analog-to-Digital (ADC) and Digital-to-Analog (DAC) converters. Important LDO parameters for audio applications are tight output accuracy, high PSRR, and low output noise.

Output voltage is specified at the connector of the power supply so it's important to consider the expected voltage drop between power supply and the point of load, especially in low voltage, high current applications. In some instances it may be possible to adjust the power supply voltage upwards manually, typically by up to 10%, to compensate for

The parameters most significant in power-supply design are cost, efficiency (battery life), output ripple and noise, and quiescent current. Table 1 illustrates the trade-off among these parameters for five power-supply architectures and five combinations of  $V_{IN}/V_{OUT}$  range.

Figure 3. Amplifiers Schematic (&#177;10-V Power Supply) Figure 3 is the &#177;10-V power supply application schematic. The best output linear range of OPA1612 is  $[-9.4\text{ V}, 9.4\text{ V}]$ , and the common mode voltage range is  $[-8\text{ V}, 8\text{ V}]$ , so in this case assume: The output voltage swing of OPA1612  $V_{swing}$  is 9.4-V peak to peak, so the feedback resistors  $R1$  ...

MOSFET. Another important factor to be considered is the number and type of power supplies required for the operation of the IC. For example, when choosing an Analog to Digital Converter (ADC), it would be essential to consider the Power Supply Rejection Ratio (PSRR) to decide on the ripple specification of the power supply that drives the ADC.

Working Principle of Power Supply. We have discussed that there are several types of power supplies. In this case, we are going to dig deeper into how it works specifically for the types of power supply we can easily make DIY for small projects. 1. Unregulated Linear Power Supply. The working mechanism can be easily and clearly explained per ...
