What is a high voltage inverter?

Typically, they are on the high voltage side (from 30 kV to 150 kV and more), and are made by connecting back-to-back controlled rectifier and inverter employing a DC bus. Dealing with high voltages, classical bridge rectifiers, and two-level inverters are not suitable due to the limited characteristics of electronic switches.

How does a high-voltage full bridge inverter work?

A high-voltage full bridge inverter works by converting the DC voltage V_1 to a high-frequency square wave AC voltage. This AC voltage is then supplied to a 20kHz frequency high-voltage transformer T1, which, after the boost rectifier, provides power to the load. The inverter high-voltage full bridge drives the routing components and the IGBT power modules.

What is the main circuit of an inverter?

The main circuit of an inverter includes an inverter DC power supply, IGBT bridge inverter, protection circuits, high frequency high voltage transformers, and high frequency high voltage silicon stack (Rectifier).

How to choose a power supply architecture for traction inverters?

There are several isolated bias power supply architectures for traction inverters and some commonly-used architectures are shown in this paper. Based on the chosen architecture, the next step is to choose a topology (flyback, push-pull, LLC resonant, integrated DC/DC module, and so forth) and the associated devices.
