Do solar-PV systems improve voltage stability?

It can be observed that solar-PV systems improve the voltage stability by enabling more reactive power reserve ($Q_s - Q_L = 615 \text{ MVAR}$) which improves the stability margin $(V_o - V_{cr})/V_o = 39\%$ of the system in comparison to SGs. Fig. 25 illustrates the reactive power output at the PCC and the terminal voltage of solar-PV systems and SGs.

How to calculate reactive power output of a solar PV system?

Therefore, the reactive power output of the solar-PV system can be expressed as a function of the solar-PV terminal voltage (V_6) and the voltage at bus-4 (V_4) as: $(24) \times 2$ where S_r is the rating of the solar-PV, P_{S2} is the active power absorbed by the load from the solar PV and n is the step-up transformer turns-ratio.
