Can a flywheel be used as a backup power supply?

Direct current (DC) system flywheel energy storage technology can be used as a substitute for batteries to provide backup power to an uninterruptible power supply (UPS) system. Although the initial cost will usually be higher, flywheels offer a much longer life, reduced maintenance, a smaller footprint, and better reliability compared to a battery.

The key to power quality is choosing the right uninterruptible power supply (UPS) for the facility's application. This post will focus on two different UPS technologies: battery and flywheel. The operational principle of a flywheel is a mechanical energy storage device that utilizes rotational momentum inertia to store and deliver back energy.

So doubling mass doubles energy storage, but doubling the rotational speed quadruples energy storage. Thus, it makes sense to use less mass to create a lighter, more compact footprint, but make the material stronger and safer (hence POWER THRU 's carbon-fiber-composite flywheel cylinder) and spin it faster to maximize energy density.
