The role of shared energy storage on the power generation side of the power system differs from the previous two applications. It serves to support the operation of thermal power units, enhance the reliability of renewable energy generation connected to the grid, and potentially remove the need for constructing alternative units.

Although the fossil-fuel based power generation is expected to be reduced for the goal of carbon neutrality, it still accounts for 62.50% of global total power generation in 2019 (International Energy Agency (IEA), 2000b). Moreover, most existing FFPPs were newly built in the past ten years and will keep a long service life for future 40 years.

When delving into the domain of REs, we encounter a rich tapestry of options such as solar, wind, geothermal, oceanic, tidal, and biofuels. Each source is harnessed using specific methodologies, including photovoltaic solar panels, wind turbines, geothermal heat pumps, subsea turbines, and biofuel plants (Alhuyi Nazari et al., 2021). These technologies have paved ...

Policy makers play a vital role in determining how the energy sector evolves over time. There is significant pressure for governments to reduce the amount of carbon dioxide (CO₂) emitted from electricity generation. As a result, many governments charge a CO₂ tax per tonne of CO₂ emitted. In addition to the CO
