Energy storage systems allow energy consumption to be separated in time from the production of energy, whether it be electrical or thermal energy. The storing of electricity typically occurs in chemical (e.g., lead acid batteries or lithium-ion batteries, to name just two of the best known) or mechanical means (e.g., pumped hydro storage).

Pumped storage has remained the most proven large-scale power storage solution for over 100 years. The technology is very durable with 80-100 years of lifetime and more than 50,000 storage cycles is further characterized by round trip efficiencies between 78% and 82% for modern plants and very low-energy storage costs for bulk energy in the GWh-class.

This is the Dinglun Flywheel Energy Storage Power Station. At 30 MW, this is likely the biggest Flywheel Energy Storage System on the planet. Don't let that spin you around though. While its sheer size is unrivaled, It's not alone. More and more people are turning to mechanical energy storage systems, like flywheels, as the
